

2018 ANNUAL DRINKING WATER QUALITY REPORT

PWSID #: 7360083

NAME: East Donegal Township Municipal Water Authority

Este informe contiene información importante acerca de su agua potable. Haga que alguien lo traduzca para usted, ó hable con alguien que lo entienda. (This report contains important information about your drinking water. Have someone translate it for you, or speak with someone who understands it.)

WATER SYSTEM INFORMATION:

This report shows our water quality and what it means. If you have any questions about this report or concerning your water utility, please contact Robert Heistand at 717-203-4845. We want you to be informed about your water supply. If you want to learn more, please attend any of our regularly scheduled meetings. They are held the third Tuesday of every month at 7:00pm in the East Donegal Township Municipal Building.

SOURCE(S) OF WATER:

Our water sources are Gladfelter Spring and two ground water wells on Rock Point Road.

A Source Water Assessment of our sources was completed by the PA Department of Environmental Protection (Pa. DEP). The Assessment has found that our sources of are potentially most susceptible to runoff from fertilizer use and erosion of natural deposits. Overall, our sources have a moderate risk of significant contamination. A summary report of the Assessment is available on the Source Water Assessment Summary Reports eLibrary web page: www.elibrary.dep.state.pa.us/dsweb/View/Collection-10045. Complete reports were distributed to municipalities, water supplier, local planning agencies and PADEP offices. Copies of the complete report are available for review at the Pa. DEP Southcentral Regional Office, Records Management Unit at (717) 705-4708.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the *Safe Drinking Water Hotline* (800-426-4791).

MONITORING YOUR WATER:

We routinely monitor for contaminants in your drinking water according to federal and state laws. The following tables show the results of our monitoring for the period of January 1 to December 31, 2018. The State allows us to monitor for some contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of our data is from prior years in accordance with the Safe Drinking Water Act. The date has been noted on the sampling results table.

DEFINITIONS:

Action Level (AL) - The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level (MCL) - The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) - The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) - The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Minimum Residual Disinfectant Level (MinRDL) - The minimum level of residual disinfectant required at the entry point to the distribution system.

Level 1 Assessment – A Level 1 assessment is a study of the water system to identify potential problems and determine (if possible) why total coliform bacteria have been found in our water system.

Level 2 Assessment – A Level 2 assessment is a very detailed study of the water system to identify potential problems and determine (if possible) why an *E. coli* MCL violation has occurred and/or why total coliform bacteria have been found in our water system on multiple occasions.

Treatment Technique (TT) - A required process intended to reduce the level of a contaminant in drinking water.

Mrem/year = millirems per year (a measure of radiation absorbed by the body)

ppm = parts per million, or milligrams per liter (mg/L)

pCi/L = picocuries per liter (a measure of radioactivity)

ppq = parts per quadrillion, or picograms per liter

ppb = parts per billion, or micrograms per liter (µg/L)

ppt = parts per trillion, or nanograms per liter

DETECTED SAMPLE RESULTS:

Chemical Contaminants								
Contaminant	MCL in CCR Units	MCLG	Level Detected	Range of Detections	Units	Sample Date	Violation Y/N	Sources of Contamination
Barium	2	2	0.087	N/A	ppm	2018	N	Erosion of natural deposits
Gross Alpha	15	0	4.6	N/A	pCi/L	2016	N	Erosion of natural deposits
Fluoride	2	2	0.26	N/A	ppm	2018	N	Erosion of natural deposits; water additive that promotes strong teeth
Nitrate	10	10	4.3	1.4-4.3	ppm	2018	N	Runoff from fertilizer use; sewage; erosion of natural deposits
Atrazine	3	3	0.1	N/A	ppb	2018	N	Runoff from herbicide used on row crops
Haloacetic Acids (Five)	60	N/A	4.2	2.7-4.2	ppb	2018	N	By-product of drinking water disinfection
Total Trihalomethanes (THM)	80	N/A	23.5	7-23.5	ppb	2018	N	By-product of drinking water chlorination
Distribution Chlorine	MRDL = 4	MRDLG = 4	1.025	0.45-1.025	ppm	2018	N	Water additive used to control microbes

*EPA's MCL for fluoride is 4 ppm. However, Pennsylvania has set a lower MCL to better protect human health.

Entry Point Disinfectant Residual							
Contaminant	Minimum Disinfectant Residual	Lowest Level Detected	Range of Detections	Units	Sample Date	Violation Y/N	Sources of Contamination
Chlorine	0.4	0.55	0.55-1.32*	ppm	2018	N	Water additive used to control microbes.

*Maximum value reported as 2309 ppm on Feb 3, 2018. This was a clerical error. True maximum value was 1.32 ppm on July 25, 2018.

Lead and Copper							
Contaminant	Action Level (AL)	MCLG	90th Percentile Value	Units	# of Sites Above AL of Total Sites	Violation Y/N	Sources of Contamination
Lead	15	0	3.9	ppb	0	N	Corrosion of household plumbing.
Copper	1.3	1.3	0.18	ppm	0	N	Corrosion of household plumbing.

DETECTED CONTAMINANTS HEALTH EFFECTS LANGUAGE AND CORRECTIVE ACTIONS:

No contaminants were detected that exceeded a regulated MLC, MRDL, or Treatment Technique. Note the maximum Entry Point Disinfectant Residual was officially reported as 2309 ppm on Feb 3, 2018. This result was a clerical error; the test was taken at 23:09 (11:09 pm), and the result was entered incorrectly. The correct entry point disinfectant residual on Feb 3 was 0.86 ppm. The true maximum value was 1.32 ppm on July 25, 2018. All of these values fall within the acceptable range for chlorine concentrations.

OTHER VIOLATIONS:

In 2018, the only violation was due to a missed test. We missed the submission date for a round of PCBs testing in 2018. These tests were completed in 2019, thus returning us to DEP compliance. The test results indicated PCB levels fall within the acceptable range.

EDUCATIONAL INFORMATION:

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result from urban stormwater run-off, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems.
- Radioactive contaminants, which can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, EPA and DEP prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. FDA and DEP regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's *Safe Drinking Water Hotline* (800-426-4791).

Information about Nitrate

Nitrate in drinking water at levels above 10 ppm in a health risk for infants of less than six months of age. High nitrate levels in drinking water can cause blue baby syndrome. Nitrate levels may rise quickly for short periods of time because of rainfall or agricultural activity. If you are caring for an infant, you should ask for advice from your health care provider.

Information about Lead

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. East Donegal Township Municipal Water Authority is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the *Safe Drinking Water Hotline* or at <http://www.epa.gov/safewater/lead>.

OTHER INFORMATION:

In 2016, water samples taken from the three sources were tested for Gross Alpha, Lead, and Copper levels, but the Maximum Contaminant Level (MLC) was not exceeded in any of the tests. In 2018, each of the sources was tested quarterly for Nitrate and once for total Trihalomethanes (THM), Haloacetic Acids (Five), Barium, Fluoride, and Atrazine. None of these detected contaminants were present in levels exceeding the MCL for the respective contaminant. The sources were also tested daily for chlorine residual, which always remained within acceptable limits. Finally, the system was tested monthly for Total Coliform Bacteria. No Coliform Bacteria was detected.
